LDCs: Growing Labor Surpluses in the 1980s

25X1

Key Judgments

*Information available
as of 5 December 1983
was used in this report.*

During the next few years, the LDCs, already beset with the debt crisis, will face the challenge of finding jobs for a large increase in the number of new workers. The high LDC birth rates of the 1960s and 1970s will lead to an addition of 545 million adults to working-age populations in Third World countries during the 1980s, an increase of 110 million more than were added in the previous decade.

25X1

This surge in the work force comes at a time that economic growth and job expansion rates are likely to be slow. Some forecasters, for example, are projecting that real growth through the end of the decade will be only about half as fast as that experienced during the 1970s. If estimates of growth prospects by region are any guide, Sub-Saharan Africa will be hardest hit because the adult population is likely to continue to grow nearly four times as fast as production. The Central American and Caribbean regions will be close behind. Several of the debt-troubled LDCs, where austerity-forced slow GNP growth is expected, will also experience rapid or accelerated growth of the working-age population.

25X1

Larger working-age populations combined with reduced real GNP gains will increase the probability of political instability in developing countries:

- Faster rural-to-urban migration to escape the poverty of subsistence farming will heighten problems of crime, disease, and squalor in the cities.
- Emigration to developed nations, both legal and illegal, will accelerate to cause resettlement problems and, in some cases, foster international ill will.
- Festering tensions between ethnic and religious groups will rise as competition for scarce jobs and housing intensifies, possibly flaring into regime-threatening violence.

25X1

US interests are likely to suffer as radical opposition groups exploit the economic hardship; these groups will attempt to direct blame for domestic problems to US policies. Additionally, economic and political crises in Central America and the Caribbean will probably mean growing pressures on US borders by illegal aliens and will raise calls among developing nations for increased US financial aid to combat overcrowding, unemployment, and refugee problems at the source.

LDCs: Growing Labor Surpluses in the 1980s

25X1

Accelerating Labor Force Growth and Weakening Economic Performance

Of the 605-million increase in the world's working-age population in the 1980s, 545 million will be added in developing countries, 110 million more persons than were added in the 1970s (figure 1).¹ According to UN estimates, more than two-thirds of the increase will be in Asia, with the remainder split between Africa and Latin America. The substantial growth of working-age population in the developing countries is largely the result of continued high fertility rates combined with the rapid decline in mortality rates that began during the 1950s and 1960s. As a result, large juvenile populations are now entering LDC work forces.

These trends in working-age populations during the 1980s will be occurring at a time that most forecasters anticipate slower economic expansion. Real GNP growth in the LDCs is projected to be well below the pace of the 1970s. Many LDCs are coping with debt problems, others suffer from the decline in oil revenues, and all face probable slower growth in exports to developed countries. Wharton Econometric Forecasting Associates (WEFA), for example, projects LDC growth output at 3.2 percent annually through 1988, barely half the 6.2-percent yearly pace enjoyed during the 1970s. The World Bank and the IMF agree that LDC economic growth will remain below the levels of the 1976-79 recovery for the next several years.

Consequently, the expansion in employment opportunities will be insufficient to absorb all new labor force participants.

Africa. Africa will be hardest pressed overall by the combination of very high population growth and poor economic performance. The non-oil-producing countries in Sub-Saharan Africa, containing about two-thirds of Africa's population, will be the most severely

affected. Kenya, Zimbabwe, Botswana, and Zambia will experience working-age population growth rates of 3.3 to 3.9 percent a year in the 1980s; during the 1970s they ranged from 2.4 to 3.3 percent (figure 2). Prospects for economic expansion are slim; the World Bank projects only slightly positive GNP growth over the medium term for Africa, and WEFA forecasts 1.1-percent annual growth through 1988. High rural underemployment, already a problem in many African nations, will get much worse.

25X1

Latin America. Parts of Latin America, especially Central America and the Caribbean, face growing economic pressure from extremely rapid working-age population growth. In El Salvador, Honduras, Mexico, Nicaragua, Suriname, and Venezuela, working-age populations will grow by at least 3.5 percent annually during the 1980s; they will grow nearly as fast in Costa Rica, the Dominican Republic, Ecuador, Guyana, Jamaica, Panama, and Peru. In nearly half of the Latin American countries the pace of working-age population growth in the 1980s will be at least as rapid as growth during the 1970s; only in Costa Rica will it be significantly lower.

25X1

25X1

These extremely rapid working-age population growth rates will compound existing labor surplus problems in this region. We estimate that unemployment already equals or exceeds 25 percent of the labor forces in El Salvador and Honduras and 20 percent in Guatemala and Nicaragua;² unemployment levels in the Caribbean countries average more than 25 percent. Consequently, many Latin American and Caribbean governments have for years tacitly or openly encouraged emigration as an avenue to relieve unemployment and population pressure.

25X1

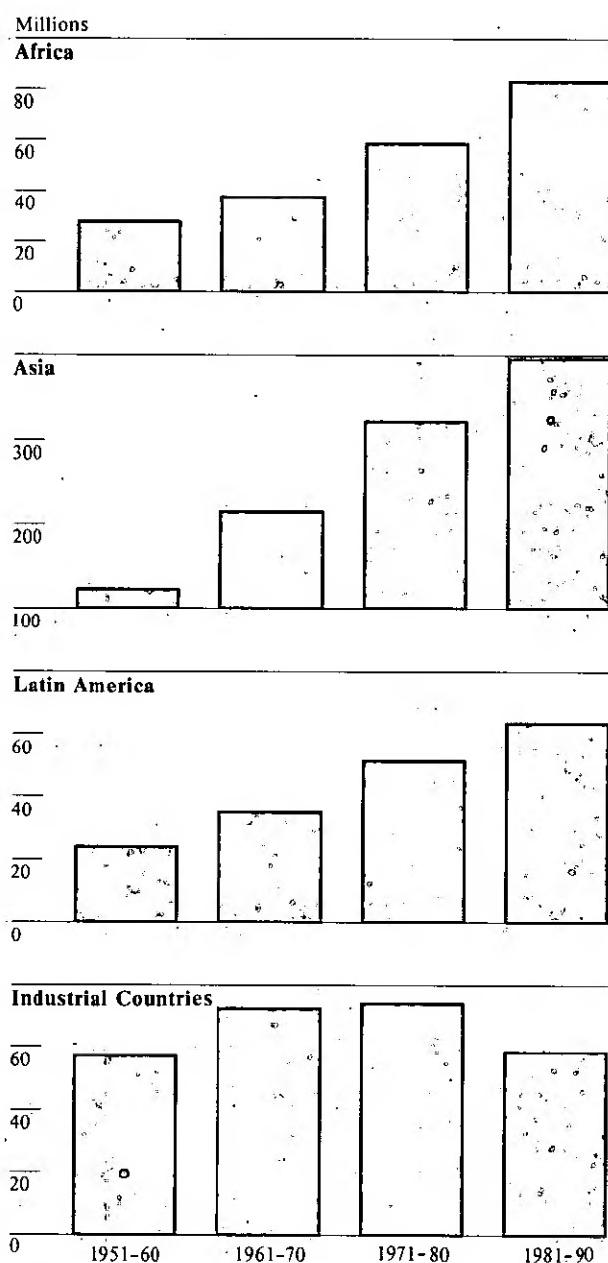

25X1

¹ Population estimates and projections are taken from the medium scenario of *Demographic Indicators of Countries*, United Nations, 1982, and we have used UN geographic groupings of countries.

Working-age population includes all persons aged 15 to 64. Appendix B presents detailed country demographic and economic trends.

On the basis of expectations of slow real GNP growth—WEFA projects an annual growth rate of only 2.6 percent in Latin America during 1983-88—sharp increases in unemployment seem inevitable. Along with slow job growth in industry and services in most of Central America and the Caribbean, the scarcity of arable land in El Salvador and Haiti and the shortage of capital for land development in other countries will intensify peasant migration to urban centers or abroad.

Middle East-Asia. According to the United Nations, the most rapidly growing working-age populations will be in the Middle East, with rates for Persian Gulf countries ranging from 3.0 to 4.6 percent annually. These projections, however, incorporate UN assumptions that significant immigration continues. To date, these countries have welcomed the rapid immigration and working-age population increases to facilitate ambitious development programs. Thus, by restricting the inflow of workers they can mitigate any surplus labor problems that might occur if development slows. To the extent that restrictions are imposed, however, the burden will be shifted to the labor-exporting countries—including Egypt, Syria, Pakistan, and Jordan—which will be hard pressed to cope.

Domestic labor-force growth will also be high in several Asian countries. India has slowed overall population expansion to an average rate of less than 2 percent through concerted efforts in family planning, but the adult population will continue to swell by about 2.5 percent, 11 million persons a year, during this decade. In Pakistan and Bangladesh adult population growth will average 3 percent or more each year, as it will in Thailand, Malaysia, and the Philippines. Economic growth—forecast at 4 to 7 percent annually for the whole of Asia and the Middle East—will ease the consequences of rapid adult population growth more than in other regions.

Strains From Increased Labor Surplus

Labor surpluses in developing countries will leave governments hard pressed for solutions to such problems as *rapid urbanization*. An example of steps that may be forced on Third World governments is the recent forcible evacuation to rural areas of 50,000 people from Maputo and other major cities in Mozambique. Rural underemployment, however, will

continue to drive urban migration in all developing countries. High urban unemployment is unlikely to alter this trend significantly because, in our judgment, the migrants will continue to perceive that their chances of improving their living standards are better in metropolitan than in rural areas. 25X1

In part because of relatively greater economic opportunities in cities, 37 percent of the population in developing countries will be in urban centers by 1990 as compared with 26 percent in 1970, according to UN projections. Infrastructure—transport, electricity, sanitation, and water supply—is likely to be strained to the breaking point in the fastest growing cities such as Mexico City, Karachi, and Jakarta despite disproportionately high public investment in urban areas. Increasing numbers of poor and illiterate rural migrants in slums could, in some countries, provide fertile ground for opposition to national regimes. 25X1

Rapid urbanization and overcrowding likely will heighten *tensions between various ethnic and racial groups* competing for scarce jobs, food, and housing. People with different languages, religions, and ethnic heritage often are barely tolerant of one another even in good times:

- Laotians, Kampucheans, and Thais despise the Vietnamese. 25X1
- Indonesians and Malays dislike Chinese and Indians.
- Ethnic and tribal tensions are a major source of Sudanese unrest.
- Burmese are hostile to Indians as are many East Africans, especially in Uganda.
- Rivalry and conflict mark relations between the Minangkabau of Sumatra and the Javanese.

These conflicts often spill over into the political arena and may, at times, escalate to regime-threatening proportions. 25X1

International migrant flows are likely to become a more politically sensitive issue during the next several years. Problems between receiving and originating countries will include workers' rights, remittance flows, and displaced employment of host countries' 25X1

Population and Key LDC Debtors

LDC debtor countries will be caught in a vice between the ill effects of continued swelling of the labor force and the need to continue austerity measures. Many of these countries are already showing economic and social strains, and the problem of finding jobs will grow progressively more difficult as ever greater numbers of young people enter the labor market (see appendix A table and figure 3):

- *More than two-thirds of Mexico's 76 million people live in metropolitan areas, and nearly one-third of all urban dwellers live in Mexico City. Unemployment and crime are becoming a way of life for many city dwellers. Restrictive policies designed to stabilize the economy will keep economic expansion well below the norm of the 1970s, aggravating the impact of continued rapid adult population growth on surplus labor.*
- *Joblessness and underemployment already are serious problems for Nigeria's nearly 45 million adults. Four-fifths of the populace depend on seasonal agricultural work, and only 20 to 30 percent of Nigeria's new secondary school graduates report finding jobs. Nonetheless, Ghanaian migrants are starting to pour back in because conditions are worse in their own country. These problems will worsen over the course of this decade.*
- *Almost one-third of Pakistan's nearly 95 million people live in overcrowded cities. Pakistan faces problems of ethnic, cultural, and linguistic differences between Pashtuns, Sindhis, Baluchis, and Punjabis, as well as about 3 million Afghan refugees. Unemployment and underemployment have made Pakistan a major source of temporary workers throughout the region, but weakening economic conditions in Gulf countries may shut this safety valve.*
- *Underemployment probably will be the worst economic problem facing Indonesia's estimated 155 million inhabitants in this decade. Nearly 2.3 million juveniles will reach adulthood each year during the remainder of the 1980s, and school leavers face poor job prospects. Adjusted unemployment, according to World Bank estimates, already exceeds 40 percent of the labor force and probably will worsen.*
- *Even though Brazil's working-age population growth will slow in this decade, we believe Brasilia will have to face major labor market problems. Already the world recession has slashed jobs and pushed unemployment to record highs (see appendix A).*

25X1

indigenous workers. Illegal migration, already on the rise, will be of particular concern as countries act to control unchecked movements of workers. India, for example, has announced its intention to fence the 2,300-kilometer border with Bangladesh to control illegal immigration and to prevent a repeat of the violence that occurred in Assam earlier this year when Bangladeshis crossed the border into the Brahmaputra Valley.

The ill effects of high unemployment and underemployment will be compounded by the need to support *large numbers of dependents*. In Africa, the dependency ratio—numbers of children under 15 and elderly (over 64) per each working-age person—is above 90 percent and still rising, compared to 50 percent in the developed countries. Asia and Latin America, further

along in the demographic transition to lower birth rates, have dependency ratios near 75 percent. High levels of adult unemployment will impact on these dependent groups by worsening housing and nutrition levels and reducing education opportunities for youngsters. Economic growth and productivity prospects could, in turn, be lowered in the decades to come.

25X1

The increase in the working-age population and the slower economic growth trends we expect in the 1980s may not cause *refugee problems*, but they will compound them. Refugees, like migrants, seek work and

25X1

Confidential

often dominate local labor markets for low-wage, low-skill employment. Additional strain is imposed on already burdened social services, and friction and resentment between refugees and native citizens are inevitable despite official welcomes and widespread attempts to locate refugees in camps away from population centers. Moreover, to the extent that rapid adult population growth strains economic conditions in poorer countries, it may even create certain refugee flows.

Refugees are already a pressing concern. At least 11 million people are now seeking refuge outside their homelands and nearly 8 million require protection and assistance from the international community. The struggle in Ethiopia, for example, has sent more than 400,000 Ethiopians and Eritreans to Sudan and an equal number of ethnic Somalis to Somalia. Some 3.5-4.5 million Afghans have fled to Pakistan and Iran. More than 200,000 displaced Khmer nationals are camped along the Thai border. And more than 180,000 Latin America/Caribbean refugees are receiving assistance in foreign countries

- The present international financial crisis could be prolonged by mounting domestic pressure in debt-ridden LDCs to provide jobs and increase welfare expenditures rather than stick to tough austerity programs.

- Problems of political refugees throughout the world, while not directly affected by rapid population growth, may worsen if economic or political conditions deteriorate. The United States may be asked to shoulder a larger share of the financial burden for UN refugee programs and may also be asked to provide more direct assistance, including asylum, for refugees.

25X1

25X1

25X1

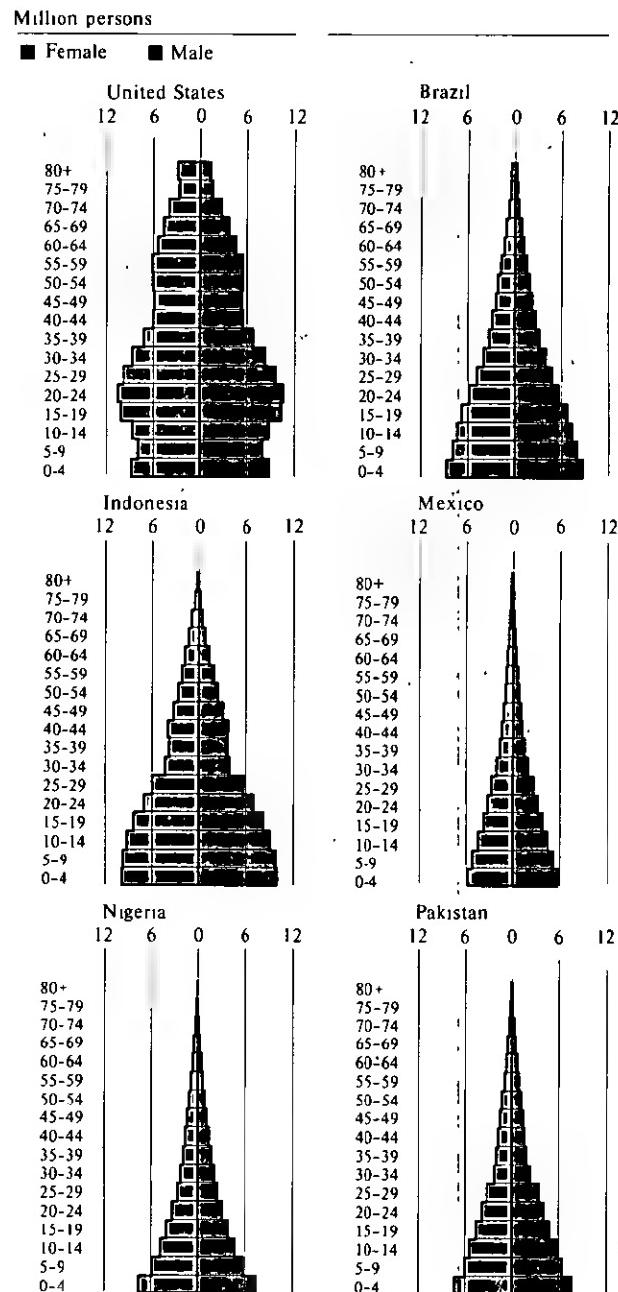

Implications for the United States

Growth in the Third World labor force during the 1980s could have several adverse consequences for US interests:

- As the Mexican and Central American economies face increased difficulties in providing employment opportunities, many workers will view migration to the United States as the best alternative. We estimate that three-fourths of known US illegal immigrants come from Mexico, El Salvador, Guatemala, and Honduras.
- In many LDCs tensions over stagnant or declining real incomes could be exploited by radical opposition groups that could blame the United States for economic problems and oppose US interests.

25X1

Confidential**Appendix A****Brazil: A Closer Look at
Labor Surpluses**

Given historical relationships between real GNP growth and employment and the dramatic slowdown in growth expected in this decade, the labor surplus outlook for Brazil—the most populous country in Latin America—is at best dismal. Even in the 1970s, when Brazil's real GNP grew at an 8.8-percent average rate, employment growth barely held even with adult population growth.

The situation turned worse in 1982-83. On the basis of estimates derived from data on manufacturing employment in the Sao Paulo area and a World Bank

study, it seems likely that Brazilian employment fell sharply last year and, at best, will hold its own this year. Since 1981 more than 2 million jobs have disappeared while the number of working-age adults seeking jobs has risen by nearly 4 million persons.

25X1

As Brazil's economic trauma ends, the rapid deterioration in the labor situation will bottom out. Unless growth rebounds far above most expectations, however, no improvement will occur for the rest of the decade, and in all probability there will be some continued deterioration.
